

# Hypoid Motor TA Series Features

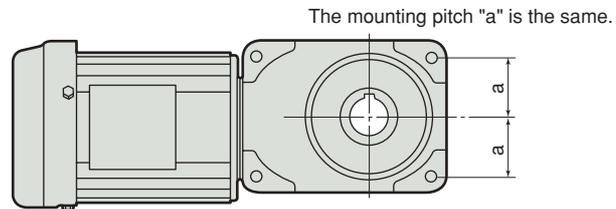

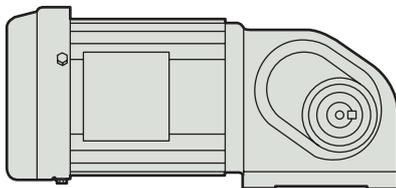

## Hypoid Motor TA Series Features

Space savings realized with hypoid gear and orthogonal-axis-type reducer that is ready for multiple applications

Unlike parallel-axis-type gear motors, the shaft of the hypoid motor does not protrude in the longitudinal direction, allowing the hypoid motor to be mounted on the inside of machinery. Even when mounted on the outside of machinery, a compact layout can be realized because it does not extend outward much, leading to space savings. The face mount type and hollow shaft type using Tsubaki's unique multi-fit system are ready for various installation modes, making it possible to simplify the layout of the whole equipment.

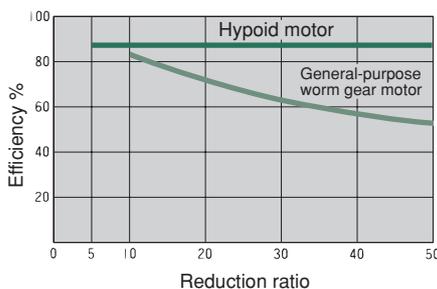

### 1 Compact

Special emphasis is placed on the height of Tsubaki's hypoid motor - a compact reducer with as low a height as has ever been realized.

### 2 High efficiency

The hypoid motor has less slippage than worm gear motors, thus providing higher efficiency. This means that the hypoid motor uses less power for the same output, which results in economical operation.

### 3 Low noise

The hypoid motor employs the new processing technology incorporated in our T series gear motor providing low noise and high reliability.

### 4 Usability

Because the product is delivered with grease injected, it can be used immediately. There is no limitation on the mounting direction. A tapped (screw) hole is included in the end of the output shaft to aid installation. For the hollow shaft type, a torque arm and a safety cap are available as options.

### 5 Inverter motor type

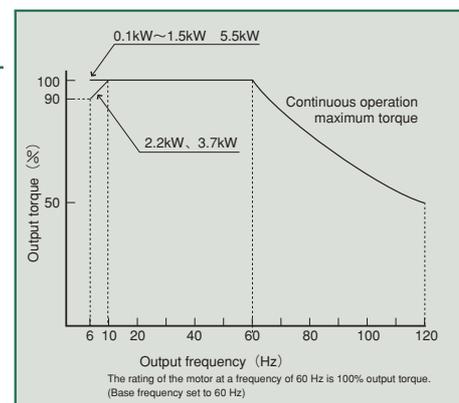

(Quick-delivery make-to-order product)

An inverter-ready motor is connected directly. Continuous operation with 100% constant torque is possible even at low frequencies (6 Hz or more). (For the 2.2 kW and 3.7 kW devices, reduction of torque is produced at frequencies of 10 Hz or less.)

In addition... ① **Quick delivery**  
Available on short delivery

② **Compact**  
Exactly the same size as the standard product

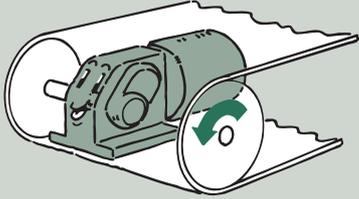

③ **Low price**  
A slight increase over the standard product of about 20%

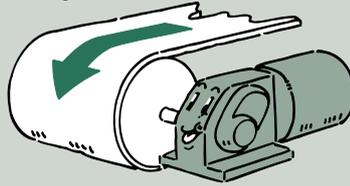

# Hypoid Motor TA Series Features

Space saving

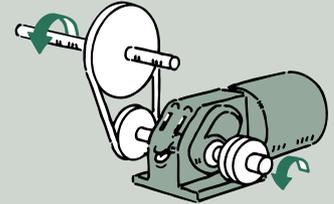

Mounted on inside of conveyor

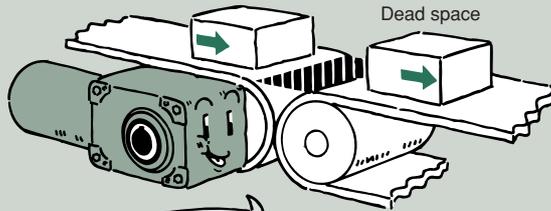

Mounted on outside of conveyor

Multiple drive

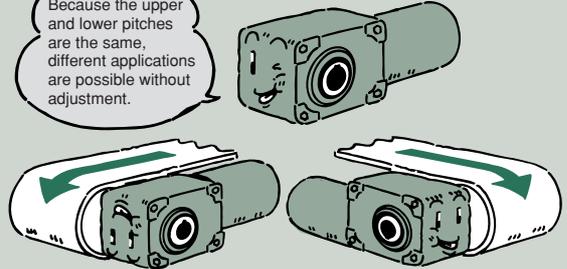

Multi-fit system

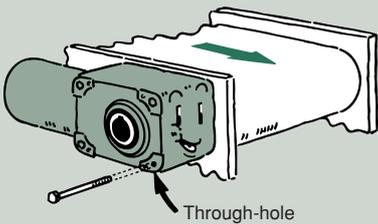

The face mount type offers a compact layout. Small dead space ensures easy transfer.

Because the upper and lower pitches are the same, different applications are possible without adjustment.

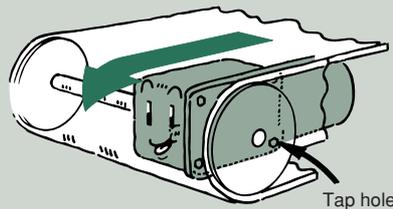

Three types of mounting

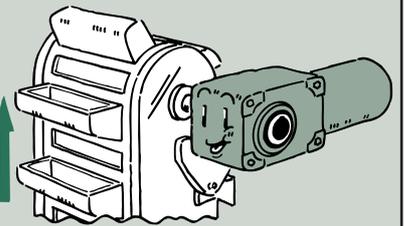

Mounted on outside of conveyor

Mounted on inside of conveyor

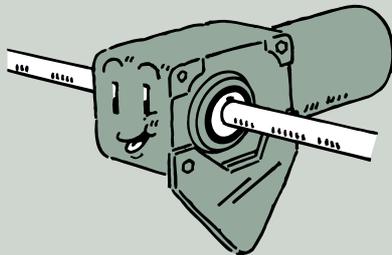

Mounted on shaft

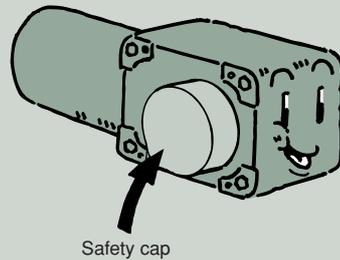

Options

Mounted on shaft with torque arm

Safety cap for added safety

# Nomenclature

Note) A combination of "brake type" and "outdoor use type" are made-to-order product.

## Codes for position of terminal box

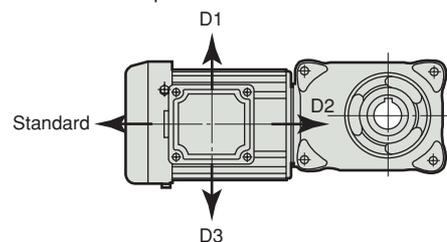

When the reduction is 1/300 or more, the terminal box is positioned differently. In this case, please contact us for details.

The directions shown by D1 and D3 in the figure above are for the outdoor-type motor with a hard terminal box. For the standard motor, change the position of the lead outlet by changing the terminal box top cover mounting direction.

## Codes for positions of the lead outlet of a hard terminal box of an outdoor type

Positions D1, D2 and D3 are obtained by rotating the lead outlet clockwise as viewed toward the terminal box by 90, 180, and 270 degrees, respectively, from the standard position of the lead outlet.
